THE INCENTIVES TO UPGRADE HAVE NEVER BEEN BETTER

Right now is the right time to simplify the management of your network -- and prepare for the next millennium -- by moving to Microsoft® Windows NT® Server 4.0. Why? Here are some key reasons:

Windows NT Server is a multi-purpose operating system that allows you to consolidate your operations. By providing high-speed file and print sharing along with broad application services on one platform, Windows NT Server helps you make your system more reliable and stable, and easier to manage.

You get more for less. Microsoft is offering a discount of approximately 20 percent off the already low Estimated Retail Price (ERP) of Microsoft Windows NT Server 4.0 [Version Upgrade \(VUP\) and Competitive Upgrade \(CUP\)](#) when you move to Windows NT Server from NetWare (other operating systems are eligible as well). In addition, by purchasing the VUP or CUP you are eligible to receive a free Services For NetWare CD (details included in the Upgrade link above). This offer is only valid within the United States and Canada, and is limited to North American English and French versions only. These incentives make it easier to move to Windows NT Server and take advantage of its combined file and print sharing and out-of-the-box application and communications services. Included are support for Exchange and other messaging applications, as well as an array of Web-related services, transactioning, scripting, component, and messaging services. While providing all these services, Windows NT Server also helps lower the cost of operating your network significantly. [Take a look at the TCO data.](#)

Year 2000 (Y2K) compliance. Moving to Windows NT Server now will allow you to become [Year 2000 compliant](#) sooner rather than later. If you already plan to move to Windows NT Server at some point, your Y2K concerns make right now a good time to do so.

FREE TOOLS MAKE THE MOVE EVEN EASIER

Microsoft provides a broad set of deployment tools to help make your move to Windows NT Server a smooth one. Be sure to read our NetWare Deployment Guide, and find out about our migration tool (included with Windows NT Server) that automatically converts NetWare users, groups, and files to Windows NT Server equivalents. That tool is part of a set of dynamic Windows-based management tools that make it easier to manage your entire network.
